ESC101: Fundamentals  
of Computing

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics  
Factorial function is defined in terms of factorial itself!

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

**Proof:** Base case: for  $n = 1$  true by inspection

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

**Proof:** Base case: for  $n = 1$  true by inspection

Inductive case:  $(1 + \dots + n) = (1 + \dots + n-1) + n = (n-1)n/2 + n = n(n+1)/2$  ☺

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

**Proof:** Base case: for  $n = 1$  true by inspection

Inductive case:  $(1 + \dots + n) = (1 + \dots + n-1) + n = (n-1)n/2 + n = n(n+1)/2$  ☺

Notice that we need a base case and recursive case

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

**Proof:** Base case: for  $n = 1$  true by inspection

Inductive case:  $(1 + \dots + n) = (1 + \dots + n-1) + n = (n-1)n/2 + n = n(n+1)/2$  ☺

Notice that we need a base case and recursive case

In case of factorial,  $\text{fac}(0)$  was the base case.

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a *recursive proof*

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

**Proof:** Base case: for  $n = 1$  true by inspection

Inductive case:  $(1 + \dots + n) = (1 + \dots + n-1) + n = (n-1)n/2 + n = n(n+1)/2$  ☺

Notice that we need a base case and recursive case

In case of factorial,  $\text{fac}(0)$  was the base case.

This is true when writing recursive functions in C language as well

# Recursion

Process of solving a problem using solutions to “smaller” versions of the same problem!

You have already encountered recursion in mathematics

Factorial function is defined in terms of factorial itself!

$$\text{fac}(0) = 1 \text{ and } \text{fac}(n) = n \cdot \text{fac}(n - 1), \text{ for } n > 0$$

Proof by induction is basically a recursive process.

**Claim:**  $1 + 2 + 3 + \dots + n = n(n+1)/2$

**Proof:** Base case: for  $n = 1$  true by inspection

$$\text{Inductive case: } (1 + \dots + n) = (1 + \dots + n-1) + n = (n-1)n/2 + n = n(n+1)/2 \quad \smiley$$

We used the proof for the case  $n-1$  to prove the case  $n$

Notice that we need a base case and recursive case

In case of factorial,  $\text{fac}(0)$  was the base case.

This is true when writing recursive functions in C language as well

# About Recursion

# About Recursion

Recursion can allow us to write very elegant code

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code ☺

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

Careful: do not forget to write down the base case

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

May end up exceeding time and memory limits on Prutor

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

May end up exceeding time and memory limits on Prutor

Will get a TLE/runtime error message on Prutor

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

May end up exceeding time and memory limits on Prutor

Will get a TLE/runtime error message on Prutor

**Careful: problems that can be solved using recursion can always be solved using loops too**

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

May end up exceeding time and memory limits on Prutor

Will get a TLE/runtime error message on Prutor

**Careful: problems that can be solved using recursion can always be solved using loops too**

Fundamental result in computer science: Church-Turing thesis

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

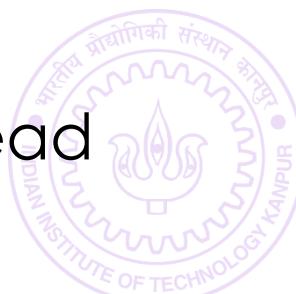

May end up exceeding time and memory limits on Prutor

Will get a TLE/runtime error message on Prutor

**Careful: problems that can be solved using recursion can always be solved using loops too**

Fundamental result in computer science: Church-Turing thesis

Disadvantage: loop solutions sometimes very difficult to write and read

# About Recursion

Recursion can allow us to write very elegant code

Very easy to understand what is going on by just reading function definition

Sometimes you can just copy the function definition into code 😊

**Careful: do not forget to write down the base case**

Will go into something like an infinite loop if you forget the base case

May end up exceeding time and memory limits on Prutor

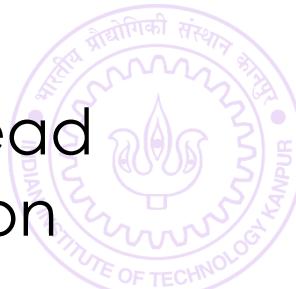

Will get a TLE/runtime error message on Prutor

**Careful: problems that can be solved using recursion can always be solved using loops too**

Fundamental result in computer science: Church-Turing thesis

Disadvantage: loop solutions sometimes very difficult to write and read

Advantage: loop solutions can be much faster than recursion solution

# Recognizing Recursion

4

# Recognizing Recursion

4

Sometimes it is very easy to see that the problem can be solved using recursion – example factorial, Fibonacci

# Recognizing Recursion

4

Sometimes it is very easy to see that the problem can be solved using recursion – example factorial, Fibonacci

Sometimes it is harder to see that recursion can be used to solve the problem – example gcd, partition

# Recognizing Recursion

4

Sometimes it is very easy to see that the problem can be solved using recursion – example factorial, Fibonacci

Sometimes it is harder to see that recursion can be used to solve the problem – example gcd, partition

No small set of golden rules on how to find out when and if a problem can be solved using recursion 😞

# Recognizing Recursion

4

Sometimes it is very easy to see that the problem can be solved using recursion – example factorial, Fibonacci

Sometimes it is harder to see that recursion can be used to solve the problem – example gcd, partition

No small set of golden rules on how to find out when and if a problem can be solved using recursion 😞

Need to look at the problem carefully and see if it can be solved using smaller versions of the same problem

# Recognizing Recursion

4

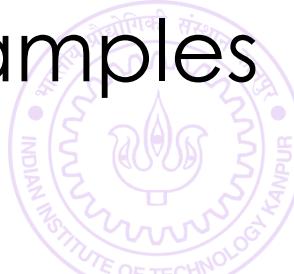

Sometimes it is very easy to see that the problem can be solved using recursion – example factorial, Fibonacci

Sometimes it is harder to see that recursion can be used to solve the problem – example gcd, partition

No small set of golden rules on how to find out when and if a problem can be solved using recursion 😞

Need to look at the problem carefully and see if it can be solved using smaller versions of the same problem

Will see several examples of this in ESC101. More examples in advanced courses e.g. ESO207, CS345

# Example 1: Factorial

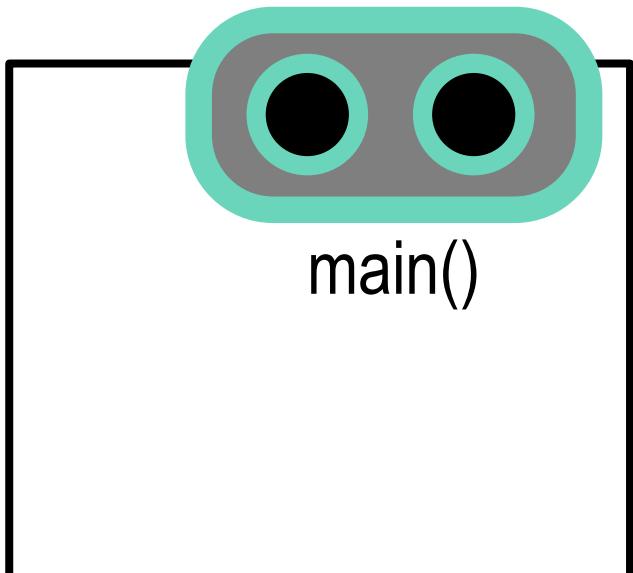

# Example 1: Factorial

```
int fact(int a){  
    if(a == 0) return 1;  
    return a * fact(a - 1);  
}  
  
int main(){  
    printf("%d", fact(1+1));  
}
```

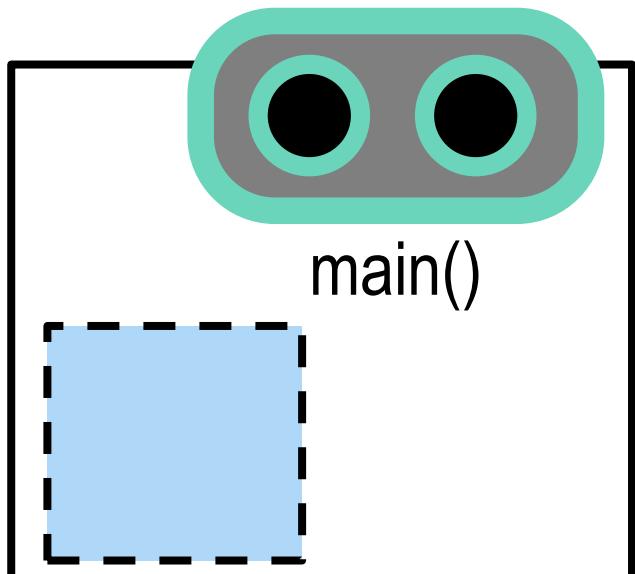

# Example 1: Factorial

```
int fact(int a){  
    if(a == 0) return 1;  
    return a * fact(a - 1);  
}  
  
int main(){  
    printf("%d", fact(1+1));  
}
```

The first Fibonacci number is defined to be 0

The second Fibonacci number is defined to be 1

Recursive case: for  $n > 2$ ,  $n$ -th Fibonacci number is the sum of the previous two Fibonacci numbers

```
int fib(int n){  
    if(n == 1) return 0;  
    if(n == 2) return 1;  
    return fib(n-1) + fib(n-2);  
}  
  
int main(){  
    printf("%d", fib(5));  
}
```

# Example 2: Fibonacci Numbers

There are two base cases for Fibonacci numbers

The first Fibonacci number is defined to be 0

The second Fibonacci number is defined to be 1

Recursive case: for  $n > 2$ ,  $n$ -th Fibonacci number is the sum of the previous two Fibonacci numbers

```
int fib(int n){  
    if(n == 1) return 0;  
    if(n == 2) return 1;  
    return fib(n-1) + fib(n-2);  
}  
  
int main(){  
    printf("%d", fib(5));  
}
```

# Example 2: Fibonacci Numbers

```

```
}
```

Wasted effort too!  
fib(1) calculated twice  
fib(2) calculated 3 times  
fib(3) calculated twice

Explosion of clones!

Imagine the number of clones to calculate fib(100). **Challenge:**

don't imagine – find out ☺

There are TWO base cases

The first Fibonacci number is defined to be 0

Second Fibonacci number is defined to be 1

... – much faster and no clones

the previous two Fibonacci numbers

```
int fib(int n){  
    if(n == 1) return 0;  
    if(n == 2) return 1;  
    return fib(n-1) + fib(n-2);  
}
```

```
int main(){  
    printf("%d", fib(5));  
}
```

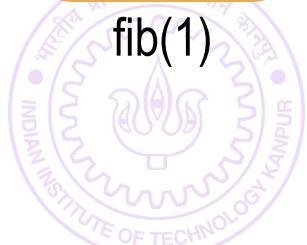

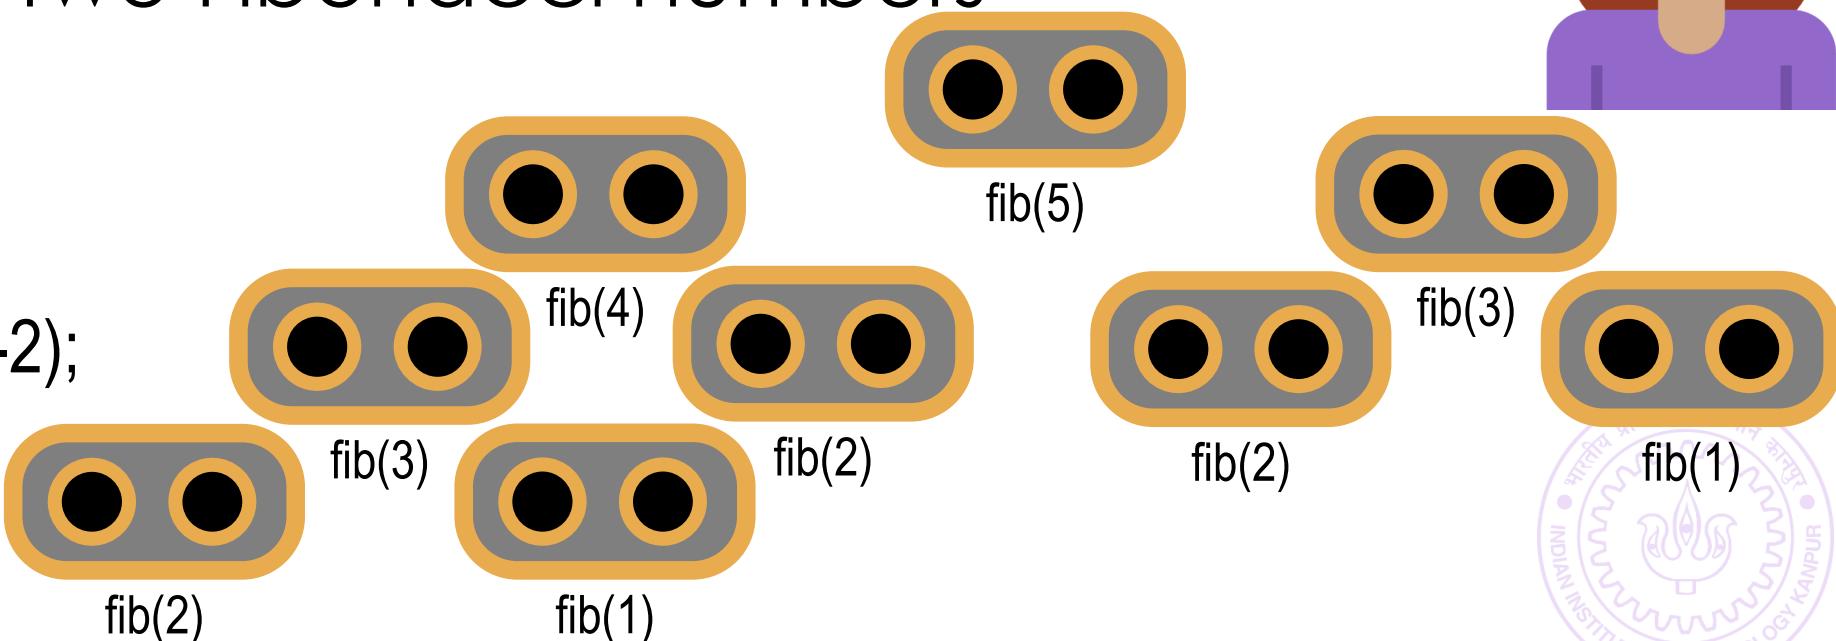

Wasted effort too!

fib(1) calculated twice

fib(2) calculated 3 times

fib(3) calculated twice

Explosion of clones!

Imagine the number of clones to calculate fib(100). **Challenge:** don't imagine – find out ☺

There are TWO base cases

The first Fibonacci number is defined to be 0.  
The second is defined to be 1.

I could have easily solved this problem using a for loop – much faster and no clones

the previous two Fibonacci numbers

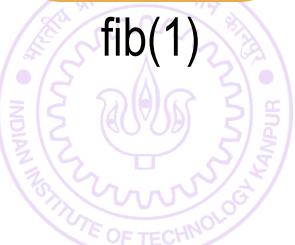

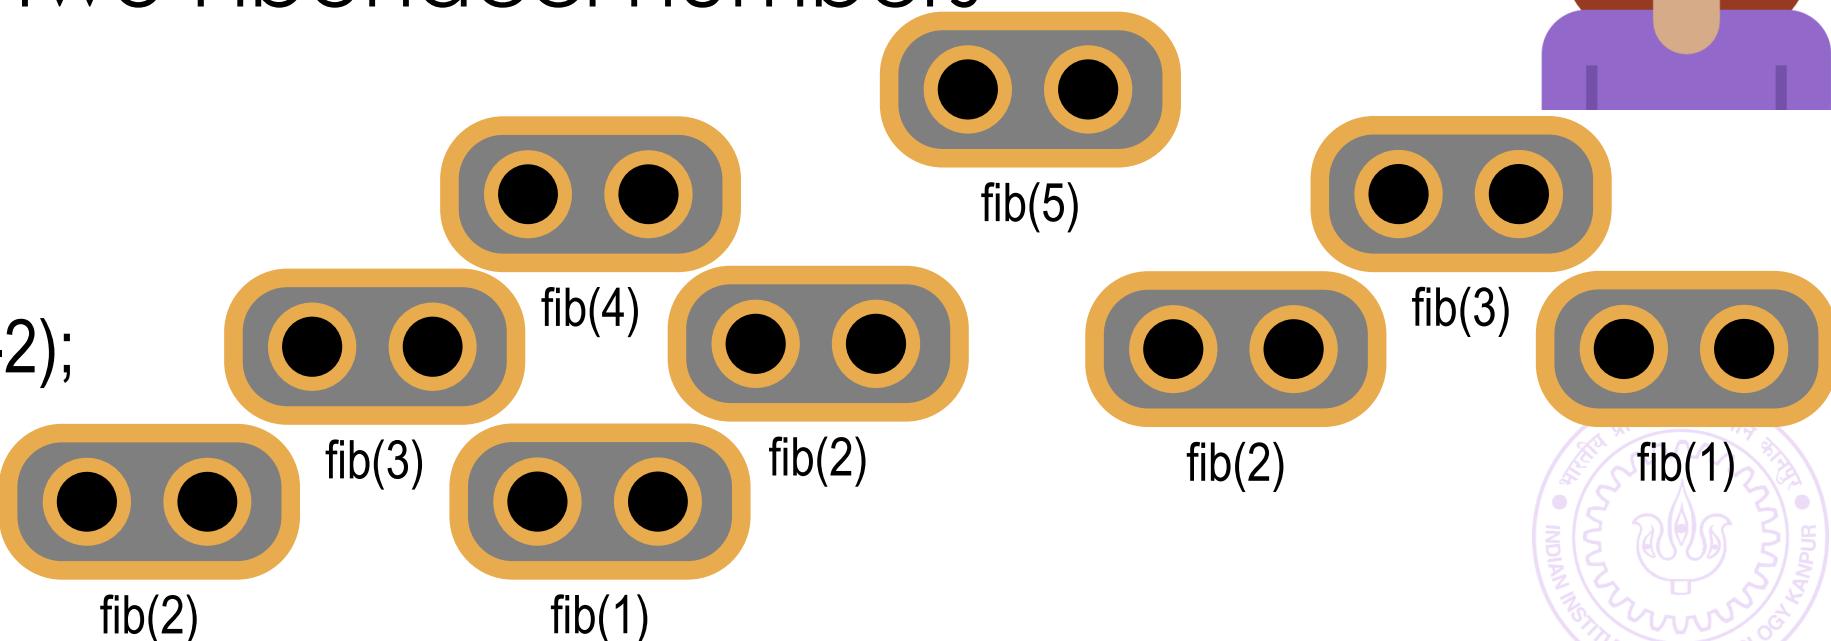

```
int fib(int n){  
    if(n == 1) return 0;  
    if(n == 2) return 1;  
    return fib(n-1) + fib(n-2);  
}  
  
int main(){  
    printf("%d", fib(5));  
}
```

Wasted effort too!  
fib(1) calculated twice  
fib(2) calculated 3 times  
fib(3) calculated twice

Explosion of clones!

That's why we were warned.  
Recursion allows neat code but sometimes can be slower

# Greatest common divisor

9

Sometimes recursion can make code faster too 😊

One of the fastest algorithms for computing gcd is called the Euclid's algorithm and it defines gcd recursively!

# Greatest common divisor

Sometimes recursion can make code faster too 😊

One of the fastest algorithms for computing gcd is called the Euclid's algorithm and it defines gcd recursively!

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\text{gcd}(a, b) = \text{gcd}(b, a \% b)$ .

# Greatest common divisor

Sometimes recursion can make code faster too 😊

One of the fastest algorithms for computing gcd is called the Euclid's algorithm and it defines gcd recursively!

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\text{gcd}(a, b) = \text{gcd}(b, a \% b)$ .

Note that since  $a \% b$  is always less than  $b$ , this indeed defines gcd in terms of gcd on “smaller” inputs

# Greatest common divisor

ESC101: Fundamentals  
of Computing

# The GCD Theorem

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

# The GCD Theorem

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

The theorem follows from the following two lemmata

# The GCD Theorem

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

The theorem follows from the following two lemmata

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

**Lemma 2.** Suppose  $p, q > 0$  are two numbers.  
Then we always have  $\gcd(p, q) = \gcd(q, p)$ .

# The GCD Theorem

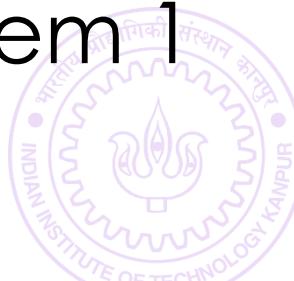

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

The theorem follows from the following two lemmata

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

**Lemma 2.** Suppose  $p, q > 0$  are two numbers.  
Then we always have  $\gcd(p, q) = \gcd(q, p)$ .

We will first assume these lemmata and prove Theorem 1  
and then prove Lemma 1.

# The GCD Theorem

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

The theorem follows from the following two lemmata

Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

**Lemma 2.** Suppose  $p, q > 0$  are two numbers.  
Then we always have  $\gcd(p, q) = \gcd(q, p)$ .

We will first assume these lemmata and prove Theorem 1  
and then prove Lemma 1.

The proof of Lemma 2 is left as an easy exercise.

# Proof of Theorem 1

11

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

Then repeatedly applying lemma 1 gives us

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

Then repeatedly applying lemma 1 gives us

$$\begin{aligned}\gcd(a, b) &= \gcd(a - b, b) = \gcd(a - 2b, b) = \gcd(a - 3b, b) \\ &= \dots = \gcd(a - k * b, b)\end{aligned}$$

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

Then repeatedly applying lemma 1 gives us

$$\begin{aligned}\gcd(a, b) &= \gcd(a - b, b) = \gcd(a - 2b, b) = \gcd(a - 3b, b) \\ &= \dots = \gcd(a - k * b, b)\end{aligned}$$

However, by the definition of  $k$ ,  $a - k * b = a \% b \circledcirc$

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

Then repeatedly applying lemma 1 gives us

$$\begin{aligned}\gcd(a, b) &= \gcd(a - b, b) = \gcd(a - 2b, b) = \gcd(a - 3b, b) \\ &= \dots = \gcd(a - k * b, b)\end{aligned}$$

However, by the definition of  $k$ ,  $a - k * b = a \% b \circledcirc$

Now applying Lemma 2 gives us

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

Then repeatedly applying lemma 1 gives us

$$\begin{aligned}\gcd(a, b) &= \gcd(a - b, b) = \gcd(a - 2b, b) = \gcd(a - 3b, b) \\ &= \dots = \gcd(a - k * b, b)\end{aligned}$$

However, by the definition of  $k$ ,  $a - k * b = a \% b \circledcirc$

Now applying Lemma 2 gives us

$$\gcd(a, b) = \gcd(a \% b, b) = \gcd(b, a \% b)$$

# Proof of Theorem 1

**Theorem 1.** Suppose  $a \geq b > 0$  are two numbers.

Then we always have  $\gcd(a, b) = \gcd(b, a \% b)$ .

Suppose  $k$  is the largest positive integer s.t.  $a - k \cdot b \geq 0$

Then repeatedly applying lemma 1 gives us

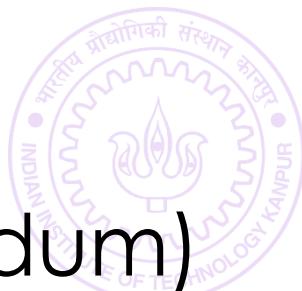

$$\begin{aligned}\gcd(a, b) &= \gcd(a - b, b) = \gcd(a - 2b, b) = \gcd(a - 3b, b) \\ &= \dots = \gcd(a - k * b, b)\end{aligned}$$

However, by the definition of  $k$ ,  $a - k * b = a \% b \circledcirc$

Now applying Lemma 2 gives us

$$\gcd(a, b) = \gcd(a \% b, b) = \gcd(b, a \% b)$$

This proves Theorem 1. QED (quod erat demonstrandum)

# Proof of Lemma 1

12

# Proof of Lemma 1

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers. Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

# Proof of Lemma 1

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

Suppose  $\gcd(a, b) = g > 0$  and say,  $a = g * m$ ,  $b = g * n$

# Proof of Lemma 1

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

Suppose  $\gcd(a, b) = g > 0$  and say,  $a = g * m$ ,  $b = g * n$

Then  $m$  and  $n$  must be coprime. If  $m, n$  have a common factor other than 1 then  $g$  will not be the gcd of  $a$  and  $b$

# Proof of Lemma 1

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

Suppose  $\gcd(a, b) = g > 0$  and say,  $a = g * m$ ,  $b = g * n$

Then  $m$  and  $n$  must be coprime. If  $m, n$  have a common factor other than 1 then  $g$  will not be the gcd of  $a$  and  $b$

E.g., if  $m$  and  $n$  have 2 as common factor i.e.  $m = 2 * r$  and  $n = 2 * s$ , then this means that  $a = 2g * r$  and  $b = 2g * s$  i.e.  $2g$  is a larger common factor of  $a, b$

# Proof of Lemma 1

**Lemma 1.** Suppose  $a \geq b > 0$  are two numbers.  
Then we always have  $\gcd(a, b) = \gcd(a - b, b)$ .

Suppose  $\gcd(a, b) = g > 0$  and say,  $a = g * m$ ,  $b = g * n$

Then  $m$  and  $n$  must be coprime. If  $m, n$  have a common factor other than 1 then  $g$  will not be the gcd of  $a$  and  $b$

E.g., if  $m$  and  $n$  have 2 as common factor i.e.  $m = 2 * r$  and  $n = 2 * s$ , then this means that  $a = 2g * r$  and  $b = 2g * s$  i.e.  $2g$  is a larger common factor of  $a, b$

The proof is compete after noticing that  $a - b = (m - n) * g$  and that  $(m - n)$  and  $n$  must be coprime which means  $g$  must be gcd of  $(m - n) * g$  and  $n * g$  i.e. gcd of  $(a-b)$  and  $b$

# Partitions

13

ESC101: Fundamentals  
of Computing

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

$$1 + 1 + 1 + 1$$

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

$$1 + 1 + 1 + 1$$

$$1 + 1 + 2$$

# Partitions

$$1 + 1 + 1 + 1$$

$$1 + 1 + 2$$

$$1 + 3$$

$$2 + 2$$

$$4$$

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

$$\begin{aligned}1 + & \boxed{1 + 1 + 1} \\1 + & 1 + 2 \\1 + & 3\end{aligned}$$

$$2 + 2$$

$$4$$

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

$$\begin{aligned}1 + & \boxed{1 + 1 + 1} \\1 + & 1 + 2 \\1 + & 3\end{aligned}$$

Note that these are  
all the partitions of 3

$$2 + 2$$

$$4$$

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

$$\begin{aligned}1 + & \boxed{1 + 1 + 1} \\1 + & 1 + 2 \\1 + & 3\end{aligned}$$

Note that these are  
all the partitions of 3

$$2 + 2$$

$$4$$

We can generate partitions of  $n$  using partitions of  $n-1$  😊

Need to be a bit careful to ensure that we do not repeat partitions i.e. we do not write both  $1 + 3$  and  $3 + 1$  since they are the same partition

# Partitions

Partitions of a number are the different ways in which we can write the number as a sum of smaller numbers

For example, the partitions of 4 are

$$\begin{aligned}1 + & \boxed{1 + 1 + 1} \\1 + & 1 + 2 \\1 + & 3\end{aligned}$$

Note that these are all the partitions of 3

$$2 + 2$$

$$4$$

Easy way of ensuring this – make sure that numbers are writing in increasing order so that  $3 + 1$  is disqualified

We can generate partitions of  $n$  using partitions of  $n-1$  😊

Need to be a bit careful to ensure that we do not repeat partitions i.e. we do not write both  $1 + 3$  and  $3 + 1$  since they are the same partition
